

Local Module Export

#Node JS Notes

Local Modules

- Local modules are modules created locally in your Node.js application.
- These modules include different functionalities of your application in separate files and folders.
- You can also package it and distribute it via NPM, so that Node.js community can use it.
- For example, if you need to connect to MongoDB / Mysql and fetch data then you can create a module for it, which can be reused in your application.

Loading Local Module

- To use local modules in your application, you need to load it using `require()` function in the same way as core module.
- However, you need to specify the path of JavaScript file of the module.

■

Example :

- `var myLogModule = require('mongooses');`

Create Local Module Using Export keyword

Export Module in Node.js

- The **module.exports** or **exports (Function)** is a special object which is included in every JS file in the Node.js application by default.
- **module** is a variable that represents current module and *exports* is an object that will be exposed as a module.
- So, whatever you assign to *module.exports* or *exports*, will be exposed as a module.

Module system

- In order to structure your program into different files, node.js provides you with a simple module system.
- Example :
 - C (#Include<headerfile>)
 - PHP(Include/Require) ,

Example

- Create 2 Files and Export Module
- Create 2 Files
 - Myfile1.js
 - Myfile.js

Export Literals Example

Create Message.js file

```
module.exports = 'Hello world';
```

app.js

- `var msg = require('./Messages.js');`
- `console.log(msg);`

```
C:\> node app.js  
Hello World
```

JS file1.js

JS file1.js > ...

```
1 //Create Module and Export  
2 module.exports = "Welcome to File 1 Code";
```

JS file2.js

JS file2.js > ...

```
1 //Load Local Module  
2 var mycontent = require('./file1.js');  
3 //Print Content  
4 console.log(mycontent);  
5
```

PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL

1: cmd

Microsoft Windows [Version 10.0.19041.685]
(c) 2020 Microsoft Corporation. All rights reserved.

D:\demo>node file2.js
Welcome to File 1 Code

Export Function

Myfile1.js

JS myfile2.js x JS myfile1.js x

```
1
2 //Created Simple Function Named World
3 exports.world = function() {
4     console.log('Hello I am File 1 Code');
5 }
6
```

//Created Simple Function Named World

```
exports.world = function() {
console.log('Hello I am File 1 Code');
}
```

Myfile2.js

JS myfile2.js x

JS myfile1.js

```
1 var mycontent = require('./myfile1');  
2 //Hello is a Simple variable Which store  
3 mycontent.world();  
4 //Above Code will Print First File Content.
```

```
var mycontent = require('./myfile1');  
//Hello is a Simple variable Which store  
mycontent.world();  
//Above Code will Print First File Content.
```

```
JS file1.js > world
1 //Create Module and Export
2 exports.world = function()
3 {
4     console.log("I am World Function");
5 }

JS file2.js > ...
1 //Load Local Module
2 var mycontent = require('./file1.js');
3 //Print Content
4 mycontent.world();

D:\demo>node file2.js
I am World Function
```

require()

- The require() function is a built-in function, and used to include other modules that exist in separate files, a string specifying the module to load.
