

#jQuery Notes

Introduction

jQuery

- jQuery is a fast, lightweight, and feature-rich JavaScript library that is based on the principle *"write less, do more"*.
- jQuery gives you the ability to create an Ajax based application in a quick and simple way.
- jQuery was originally created by John Resig in early 2006.

Use Of jQuery

- You can easily select elements to perform manipulation.
- You can easily create effect like show or hide elements, sliding transition, and so on.
- You can easily create complex CSS animation with fewer lines of code.
- You can easily implement Ajax to enable asynchronous data exchange between client and server.
- You can easily perform multiple actions on an element with a single line of code.
- You can easily get or set dimensions of the HTML elements.

Advantages Of jQuery

- Save lots of time
- Simplify common JavaScript tasks
- Easy to use
- Compatible with browsers
- Absolutely Free

jQuery Getting Started

- To get started, first download a copy of jQuery and include it in your document.
- You can download jQuery from here: <https://jquery.com/download/>

- There are two versions of jQuery available for downloading — *compressed* and *uncompressed*.
- The **uncompressed** file is best suited for development or debugging.
- <https://code.jquery.com/jquery-3.4.1.js>
- The minified and **compressed** file is recommended for production because it saves the precious bandwidth and improves the performance due to small file size.
- <https://code.jquery.com/jquery-3.4.1.min.js>

- Once you've downloaded the jQuery file you can see it has .js extension, because the jQuery is just a JavaScript library.
- Therefore you can include the jQuery file in your HTML document with the `<script>` element just like you include normal JavaScript files.

jQuery Syntax

- A jQuery statement typically starts with the dollar sign (\$) and ends with a semicolon (;).
- Syntax:-

```
<script type="text/javascript">
    $(document).ready(function() {
        // Some code to be executed...
        alert("Hello World!");
    });
</script>
```

Explanation

- The `<script>` element —the jQuery code can be placed inside the `<script>` element.
- The `$(document).ready(handler);` — This statement is typically known as ready event.
- Where the handler is basically a function that is passed to the `ready()` method to be executed safely as soon as the document is ready to be manipulated

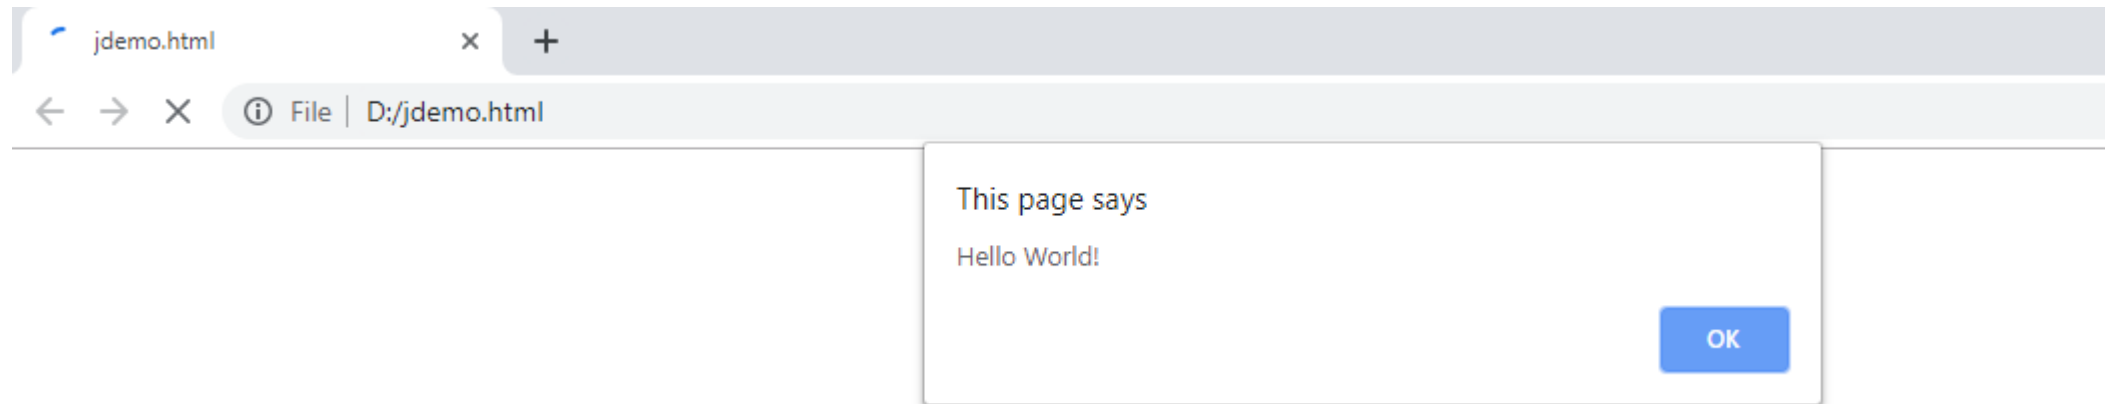

Example (Alert)

```
<!DOCTYPE html>
<html>
<head>
  <script src="https://code.jquery.com/jquery-1.12.4.min.js"></script>
  <script type="text/javascript">
    $(document).ready(function(){
      alert("Hello World!");
    });
  </script>
</head>
<body>
</body>
</html>
```

Output

jQuery Selectors

- Types of jQuery Selectors :-
 - Selecting Elements by ID
 - Selecting Elements by Class Name
 - Selecting Elements by Name
 - Selecting Elements by Attribute

Selecting Elements by ID

- You can use the ID selector to select a single element with the unique ID on the page.

Example

```
<!DOCTYPE html>
<html>
<head>
  <script src="https://code.jquery.com/jquery-1.12.4.min.js"></script>
  <script type="text/javascript">
    $(document).ready(function() {
      // Highlight element with id at
      $("#at").css("background", "blue");
    });
  </script>
</head>
<body>
  <p id="at">This is a paragraph.</p>
  <p>This is another paragraph.</p>
</body>
</html>
```

Output

This is a paragraph.

This is another paragraph.

Selecting Elements by Class Name

- The class selector can be used to select the elements with a specific class.

Example

```
<!DOCTYPE html>
<html>
<head>
  <script src="https://code.jquery.com/jquery-1.12.4.min.js"></script>
  <script type="text/javascript">
    $(document).ready(function(){
      // Highlight elements with class at
      $(".at").css("background", "yellow");
    });
  </script>
</head>
<body>
  <p class="at">This is a paragraph.</p>
  <p>This is another paragraph.</p>
</body>
</html>
```

Output

This is a paragraph.

This is another paragraph.

Selecting Elements by Name

- The element selector can be used to select elements based on the element name.

Example

```
<!DOCTYPE html>
<html>
<head>
  <script src="https://code.jquery.com/jquery-1.12.4.min.js"></script>
  <script type="text/javascript">
    $(document).ready(function(){
      // Highlight h1 elements
      $("h1").css("background", "green");
    });
  </script>
</head>
<body>
  <h1>This is heading</h1>
  <p>This is a paragraph.</p>
</body>
</html>
```

Output

This is heading

This is a paragraph.

Selecting Elements by Attribute

- You can use the attribute selector to select an element by one of its HTML attributes, such as a link's target attribute or an input's type attribute, etc.

Example

```
<!DOCTYPE html>
```

```
<html>
```

```
<head>
```

```
  <script src="https://code.jquery.com/jquery-1.12.4.min.js"></script>
```

```
    <script type="text/javascript">
```

```
    $(document).ready(function() {
```

```
      $('input[type="text"]').css("background", "blue");
```

```
    });
```

```
  </script>
```

```
</head>
```

```
<body>
```

```
  <label>Name: <input type="text"></label>
```

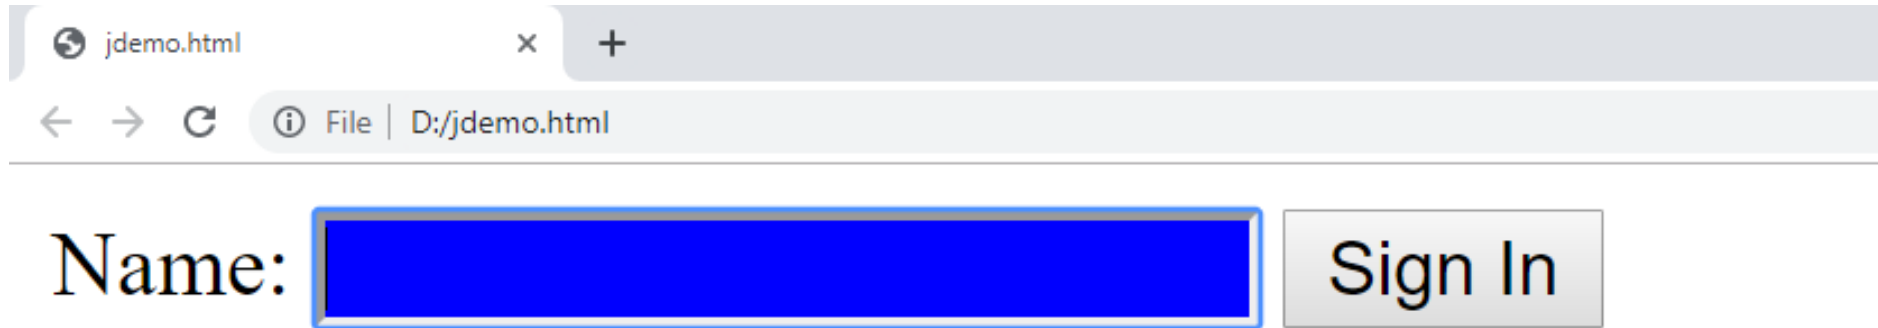

```
  <input type="submit" value="Sign In">
```

```
</body>
```

```
</html>
```

Output

A screenshot of a web browser window. The address bar shows 'jdemo.html' and the file path 'D:/jdemo.html'. The page content includes the text 'Name:' followed by a text input field with a blue border and a 'Sign In' button.
